1 Summary

Recent B.Tech graduate in Electronics and Communication Engineering with hands-on experience building AI/ML systems end to end. Comfortable working across the full pipeline — data preprocessing, model integration, API design, and deployment — with practical exposure to classical ML, deep learning for computer vision, and emerging GenAI workflows involving LLM APIs, retrieval-augmented generation, and vector databases. Looking to bring this builder's mindset to an AI/ML Engineer role.

2 Education

Amrita Vishwa Vidyapeetham, Bengaluru — B.Tech, Electronics and Communication Engineering	2022 – 2026
DR Academy — Pre-University, State Board	89%
Varin International Residential School — Secondary School, ICSE	81.6%

3 Technical Skills

- **Languages:** Python, SQL, C
- **Machine Learning:** Scikit-learn, LSTM, CNNs, Predictive Modeling, Anomaly Detection
- **Computer Vision:** OpenCV, YOLO, Real-Time Video Processing
- **GenAI & Automation (Working Knowledge):** n8n, RAG (Retrieval-Augmented Generation), Vector Databases (Pinecone), Gemini API
- **Data:** Pandas, NumPy, Data Cleaning & Preprocessing, Power BI (DAX, Power Query)
- **Tools & Frameworks:** Flask, Django, Git/GitHub, Excel

4 Projects

AI News Aggregation & Voice Agent

n8n, Gemini API, RAG, Vector DB (Pinecone)

- Built an automated pipeline that pulls live articles from 7 RSS feeds (~376 articles per run) and categorizes them using batched LLM calls through Gemini, cutting API usage from 376 calls to about 39 per run.
- Designed a dedup and cross-verification module that groups related articles by keyword overlap and flags a story as verified once 2 or more outlets report it.
- Set up a Pinecone vector index with Gemini embeddings to support RAG-based retrieval, laying the groundwork for a voice-driven Q&A layer.

Anomaly Detection in Industrial IoT (AWHA)

Python, Scikit-learn, LSTM

- Built preprocessing and validation pipelines for multivariate industrial IoT time-series sensor data.
- Applied LSTM and Scikit-learn models to flag abnormal equipment behavior for downstream monitoring dashboards.

Driver Drowsiness Detection System

OpenCV, LSTM

- Built a real-time computer vision system that processes live video to detect signs of driver fatigue.
- Implemented LSTM-based sequence detection with automated alerts, validated for accuracy across iterative testing rounds.

Plant Disease Diagnosis Assistant

CNN (EfficientNetV2B0), Flask

- Fine-tuned a CNN-based image classification model that reached 89% accuracy with under 50ms inference time.
- Combined the model with a rule-based expert system behind a Flask API, adding multilingual support (Kannada, Telugu, Hindi) for real-world use.

5 Training & Certification

- Incubation Student, PySpiders — Python for Data Science Track: structured training in Python, SQL, Power BI, and end-to-end analytics workflows (Pandas, NumPy, Matplotlib, Seaborn) alongside foundational ML concepts.

6 Extracurricular Activities

- Executive, Smriti — University Photography Club: organized workshops and cross-team collaborative media projects.
- Movies Division executive, Dastaan Media Team: produced promotional content and coordinated live event media coverage.
- Core Committee Member, National Level Fest: managed vendor and team operations for a revenue-generating unit during a large-scale multi-day event.
